

CHAPTER V

Conclusion

5.1 Conclusion

Code switching, which includes intrasentential, tag, and intersentential switching, is the act of alternating between two or more languages or dialects during a discourse. Tag switching is the process of integrating a tag phrase from one language into another sentence. Intrasentential code switching takes place within a single sentence, whereas intersentential code switching happens between sentences. Interesting insights regarding Nessie Judge's linguistic usage can be gained by analyzing the data from her tweets. According to the author's examination, the most common type of code switching in Nessie Judge's statements is intersentential switching.

5.2 Suggestion

The writer of this paper would like to offer a few suggestions based on the previously discussed study findings that could potentially be helpful to readers and other researchers who are interested in studying sociolinguistics, particularly code switching. The researcher further believes that students in the English Department, particularly those majoring in linguistics, may find this research valuable. Here are some suggestions:

1. To scholars and learners

- They look into any additional code turning research because it's an intriguing problem to examine.
- They talk about code switching from different media, including dramas, films, and books.
- The author acknowledges that there are errors in the research analysis and that using monologue speeches as the data type for social factor analysis caused misconceptions. It would be preferable and advised for other researchers to use dialogue speeches in their future social factor research.

2. To the reader

- Code switching is one of the research areas of interest in sociolinguistics, and they can utilize this study as one of their sources to learn more about it.
- To learn more about code switching, they use this research as one of their sources of information.
